## Challenges / Problems

- Japan consumes over 20 billion disposable 'waribashi' chopsticks annually, incinerated adding carbon to the atmosphere. The real estate industry relies on imported wood or harvested trees for many surfaces.

## Proposed solutions

- Pioneering circular economy business building a decentralized, global manufacturing network in over 65 locations worldwide, our technology revolutionizes the utilization of discarded resources into high-quality, market-ready end products for various applications.

## Competitive advantages:

- Utilize urban resources to extend the duration of the carbon retained in the wood. Recognition as a Top 5% certified B-Corporation. Microfactories require no water and less than 100 tsubo of space. Provide local jobs and community engagement.

## Looking for collaboration / partnership with:

- Sustainability-focused Investors
- Growth partners to support Japan market penetration including real estate developers, OEM manufacturers, waste management companies, restaurant chains, general contractors, end clients, etc.

## Future business plan:

- Set-up of Tokyo-based initial microfactory operation
- Scale to major Japanese points of chopstick consumption.
- Expand into additional waste streams (already in development globally)
